

## Application Note AN-RS-044

# Optimize raw material identification and verification (RMID) with MIRA P

# Validation model transfer increases productivity

Using a verification model on multiple instruments expands a manufacturer's raw material identification/verification (RMID) capabilities by speeding up incoming inspection, imparting flexibility to an operation, or avoiding downtime.

In a scenario where several operators use multiple MIRA P systems at different locations, the ability of any operator to use any MIRA P to validate a new shipment streamlines operations and allows that shipment to be quickly released to production.

In most cases, a well-designed model with inherent sample variability can be built on one MIRA P and transferred to another. In some cases, variance must be added to a training set with a few additional samples. This Application Note describes how a model transfers from one MIRA P to another in order to scale MIRA P usage across an entire operation.

### INTRODUCTION

Model building (including training and validation set samples, operating procedure (OP) settings, and necessary variance) has already been well-established for RMID with a unique MIRA P [1,2].

In summary, MIRA Cal P generates PCA-based (principal component analysis) models using Training Set data and Operating Set parameters to verify target substances. Ideally, a model can be created on one instrument («MIRA P 1»),

downloaded onto a second instrument («MIRA P 2»), then validated on the second unit and used directly.

The model must be expanded if the initial transfer does not produce satisfactory p-values or does not pass validation. This involves introducing variance in the model and/or optimizing model parameters and/or ensuring consistent usage by each operator of the instrument.

### **MODEL TRANSFER**

This Application Note details the:

- 1. transfer of a material verification model from one MIRA P to another MIRA P
- 2. validation of the success of the model transfer
- 3. expansion of the model using a transfer matrix, if necessary

Contact your local Metrohm Sales and/or Service Representative for the full MIRA P to MIRA P Transfer Protocol.

Parameter optimization and/or inclusio

n of additional data that includes instrument variance and variance based on historical and current samples are both simple ways to expand a model.

Using an established model, new validation data is collected from both MIRA P units and added to the Training Set. Parameter optimization is recommended at this step. After this updated model is uploaded to the new MIRA P unit, it must be validated on the new unit

### **VALIDATION**

Validation of a model demonstrates that the model adequately assesses a material on a new instrument. In other words, validation data serves as a «diagnosis» of how the model performs on the new unit.

Validation is an assessment of a method using test samples:

- that are expected to PASS (positive samples). These are samples of the target material but are different than the samples used to build the Training Set.

- that are expected to FAIL (negative samples). These can either be dissimilar materials or similar yet different materials. This ensures the specificity of a model.

It is a simple task, requiring just a few minutes, to run a validation set. This will inform successive steps.

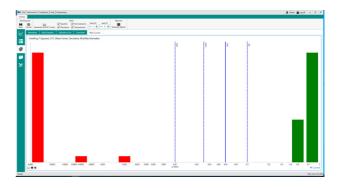

A good way to assess the success of a transferred model is to look at p-value distributions of positive and negative Validation Set samples. This is a good measure of a model's robustness—its ability to correctly assess new

data, not just the data it was trained on. For example, **Figure 1** contains Validation Set results for sodium bicarbonate on the receiving MIRA P device (MIRA P 2).

Initial Validation results for sodium bicarbonate show all the characteristics of good validation results (**Figure 1a**).

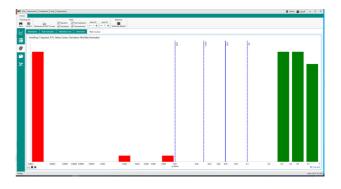

Red bars indicate that negative validation samples are failing appropriately, and positive samples are also passing with high p-values.

**Figure 1a.** Validation results for sodium bicarbonate on MIRA P: the original model.

After transfer to MIRA P 2 (**Figure 1b**), p-values for negative and positive samples show greater variance, but all are passing/failing appropriately.

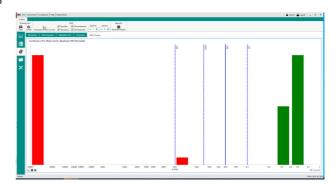

Ultimately, this is a good example of a model that was transferred and used immediately.

**Figure 1b.** Validation results for sodium bicarbonate on MIRA P: the model after transfer to another unit.

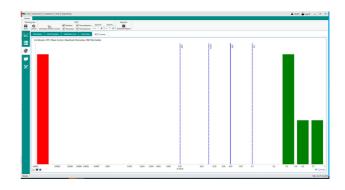

### HOW MANY OPTIMIZATIONS ARE NEEDED?

Lactose fluoresces with 785 nm Raman, but a well-built model can accommodate such fluorescence. This is a good test of the model transfer capability. The lactose model transfers easily, requiring only parameter optimization in MIRA Cal P and addition of a small number of scans from the new instrument to the training set (**Figure 2**).

**Figure 2a.** Validation results for lactose on MIRA P: the original model

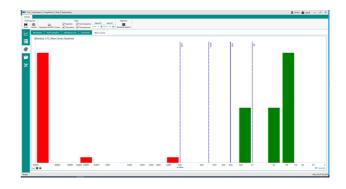

P-values exhibited slightly more variance on the new instrument (**Figure 2b**), but the model was robust.

**Figure 2b.** Validation results for lactose on MIRA P: the model after transfer and parameter optimization.

Microcrystalline cellulose (MCC) is a challenging sample for 785 nm Raman, as it is very fluorescent. This can be seen in the wider distribution of validation set p-values in the original model (**Figure 3a**).

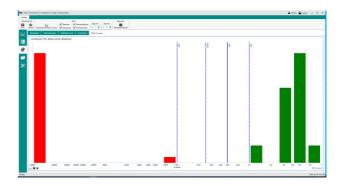

Thus, it was not expected for the original model to transfer without the Transfer Matrix.

**Figure 3a.** Validation results for microcrystalline cellulose (MCC) on MIRA P: the original model

Ultimately, the optimization of parameters and utilization of the Transfer Matrix provided a robust model that could be used on a second MIRA P instrument and with a smaller spread of p-values.

**Figure 3b.** Validation results for microcrystalline cellulose (MCC) on MIRA P: the model after parameter optimization and Transfer Matrix.

### **COMPLIANCE**

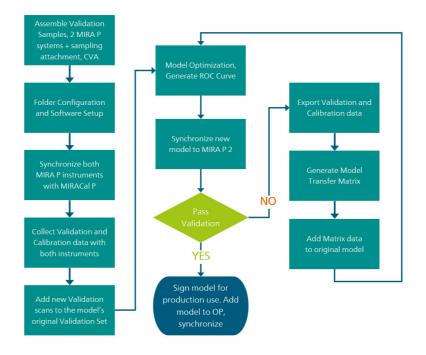

Compliance with 21 CFR Part 11 requires document control at the highest level. Specifically, all model metadata is preserved, ensuring traceability after model transfer. The manufacturer-supported means

The benefits of using multiple MIRA P devices for raw material verification include smoother operations and faster turnaround of products. This Application Note is intended to guide users through model transfer and enable the deployment of multiple MIRA P instruments.

for this are simple: MIRA P Model Transfer Protocol includes a sign-off sheet to record and track data from MIRA Cal P export, through the transfer matrix, and import back into MIRA Cal P.

From tips for the simplest transfer to tools for more challenging tasks, we want you to be confident in taking your inspection with MIRA P to the next level. This flowchart is a quick reference for the basic flow of operations during MIRA P to MIRA P transfer.

### CONFIGURATION

### MIRA P Basic

Metrohm Instant Raman Analyzer (MIRA) Pは、薬品有効成分や賦形剤なと様々な物質タイフを、迅速かつ非破壊で測定およひ検証するための、高性能なホータフル型ラマンスへクトロメーターです。 MIRA Pは、サイスはコンハクトですか堅固なテサインで、当社独自の軌道ラスタースキャン技術 (Orbital Raster Scan Technologie, ORS) を備える、作業効率の高い分光器を搭載しています。 MIRA Pは、FDA 21 CFR Part 11の基準に完全に準拠しています。

MIRA P 基本ハッケーシにより、ユーサーは MIRA P をこ自身の要望に適合させることかてきます。 MIRA DS 基本ハッケーシは、Mira Pの稼働に必要な基礎コンホーネントを含む導入ハッケーシです。 基本ハッケーシには、Mira校正/検証用アクセサリー、USPライフラリ、ホトルまたは袋て分析するためのLWDアタッチメントか含まれています。レーサー安全クラス3B操作。

### MIRA P Advanced

Metrohm Instant Raman Analyzer (MIRA) Pは、迅速な非破壊的計測および薬品有効成分や賦形剤なとの様々な物質の検査に使用てきる、高性能な携帯型ラマン分光計です。サイスはコンハクトですか、MIRA Pは非常に堅固で、弊社独自の軌道ラスタースキャン技術 (Orbital Raster Scan Technologie, ORS) を備えた作業効率の高い分光技術構造を有しています。MIRA PはFDA規則 21 CFR Part 11の要件を満たしています。

Advanced Packageには、物質を直接、またはオリシナル容器で分析することか可能なアタッチメントレンス (レーサークラス3b)、およひカラスハイアル中のサンフル分析のためのハイアルホルターアタッチメント (レーサークラス1) か含まれています。

### MIRA P Flex

MIRA P Flex Packageにより、ユーサーは MIRA P をこ自身の要望に適合させることかてきます。Flex Package には、サンフル採取のためのアタッチメント無しの MIRA P の稼働に必要なすへての基本コンホーネントか含まれています。稼働するには、サンフル採取のためのアタッチメントか最低1つは必要となります。MIRA P Flex Package には、USPライフラリ、校正標準/検証のための付属品、およひUSBケーフルか含まれています。クラス 3B ての稼働。
